

## **GEAGROUND FCO**

<b>Chemical Nature:</b>	combination of natural and synthetic waxes and binders
<b>Solids Content:</b>	approx. 8,5%
<b>Ionic Charge:</b>	anionic
<b>Aspect:</b>	yellowish liquid
<b>Utilization:</b>	finishings that require equalisation and resistance to polishing as well as imparting intense gloss.

### **PROPERTIES**

---

GEAGROUND FCO has been especially formulated to be used in light finishings requiring optimal equalisation and silky feel as well as imparting intense, natural gloss when polished or plated. Because it is extremely reactive to heat, GEAGROUND FCO provides a high burnishing effect even when combined with pigments. It is recommended that 350 to 400 parts of GEAGROUND FCO be used together with up to 50 parts of pigment and sufficient water to achieve the above mentioned effect. For higher resistances, it is recommended to employ acrylic or polyurethane binders that do not interfere with the polishing and reactivity characteristics of the product.
