

GEATAN GT

Chemical Nature:	aliphatic aldehyde
Active Substance:	approx. 50%
pH (10%):	approx. 7,0
Ionic Charge:	anionic
Aspect:	liquid
Utilization:	pre-tanning and retanning of chrome-tanned and metal-free leather.

PROPERTIES

GEATAN GT is a tanning agent with a wide spectrum of application. When applied as a pre-tanning agent, it helps the penetration and distribution of chromium and vegetable tannins. If used before rechroming it provides a higher degree of softness, filling and feel evenness all over the hides. When applied at the beginning of the retanning process, besides increasing the exhaustion of the retanning products, GEATAN GT produces leather with firm grain, fine pores and bright, very even colours. If applied together with the main fatliquoring, it enhances the distribution and penetration of oils and natural fat, thus resulting in better fatliquor yield, higher degree of softness and lower specific weight of the leather. It imparts excellent light fastness and, due to its chemical nature, GEATAN GT helps improve tear resistance.
